

## DSA Exam S1

```
typedef struct agenda {  
    char name[35];  
    char phone[10];  
    int year;  
    int income;  
} agenda;
```

agenda arr[N]; // global array, N could be a define

b) // Sort the array using select sort,  $O(n) = n^2$ , even if  
// it's not the most efficient, we can't use qsort on the  
// array, because we have to ignore the elements outside  
// year  $\in [30, 40]$ .

```
void sort_arr() {  
    for (int i = 0; i < N; i++) {  
        if (arr[i].year > 40 || arr[i].year < 30) {  
            continue;  
        }  
        for (int j = i + 1; j < N; j++) {  
            if (arr[i].year > arr[j].year) {  
                // swap  
            }  
        }  
    }  
}
```

// else compare and swap if in reverse order

```
if (strcmp(arr[i].name, arr[j].name) < 0) {  
    // reverse order - swap → decreasing order  
    agenda temp = arr[i];  
    arr[i] = arr[j];  
    arr[j] = temp;  
}
```

}  
// space complexity  $M$ , time complexity  $n^2$

a) // most efficient way is to store the 2 agendas  
// and shift the whole array by 2 at once

```
void move() {  
    int a1, a2; int counter = 0;  
    for (int i = 0; i < N; i++) {
```

```
        if (arr[i].income < 1000) {
```

```
            if if (counter == 0) {
```

```
                a1 = i;
```

```
                counter++;
```

```
            }
```

```
            if (counter == 1) {
```

```
                a2 = i;
```

```
                break;
```

```
            }
```

q1)

// after  $a_1, a_2$  stored index, we ~~store~~ <sup>shift elements</sup>  
agenda  $ag_1 = arr[a_1], ag_2 = arr[a_2]$ ; // store them.  
for (int  $i = a_1, i < a_2 - 1, i++$ ) {  
     $arr[i] = arr[i+1];$   
}  
for (int  $i = a_2 - 1, i < N - 2, i++$ ) {  
     $arr[i] = arr[i+2];$   
}  
~~arr~~  $arr[N-2] = ag_1;$   
     $arr[N-1] = ag_2;$   
//  $O(n) = n$  - linear algorithm.
